

## Binary Composition:

Let,  $A$  be a non-empty set. A binary composition (or binary operation) on  $A$  is a mapping  $f: A \times A \rightarrow A$ . This mapping  $f$  is generally denoted by the symbol  $\odot$  or  $\circ$ . For a pair of elements  $a, b$  in  $A$ , the image of  $(a, b)$  under the binary composition (BC)  $\circ$  is denoted by  $a \circ b$ . The image of the element  $(b, a)$  is  $b \circ a$ .

The symbols like  $*$ ,  $+$ ,  $\cdot$  are also used to denote a BC.

**Ex.1.** On the set  $\mathbf{Z}$  let  $\circ$  stand for the BC 'addition'. Then  $2 \circ 3 = 5$ ,  $4 \circ -4 = 0$ .

**Ex.2.** On the set  $\mathbf{Z}$  let  $\circ$  stand for the BC 'multiplication'. Then  $2 \circ 3 = 6$ ,  $4 \circ 0 = 0$ .

Contd.

**Ex.3.** On the set  $\mathbf{Z}$  let  $\circ$  stand for the BC 'subtraction'. Then  $3 \circ 2 = 1$ ,  $1 \circ 3 = -2$ .

**Ex.4.** On the set  $\mathbf{Z}$  let  $\circ$  stand for the BC defined by  $a \circ b = a + 2b$ ,  $a, b \in \mathbf{Z}$ . Then  $2 \circ 3 = 8$ ,  $3 \circ 0 = 3$

**Ex.5.** 'subtraction' is not a BC on the set  $\mathbf{N}$  since  $2, 3 \in \mathbf{N}$  but  $2 - 3 \notin \mathbf{N}$ .

A BC  $\circ$  is said to be defined on a non empty set  $A$  if  $a \circ b \in A \forall a, b \in A$ . In this case the set  $A$  is said to be closed under the BC  $\circ$ . For ex.  $\mathbf{N}$  is closed under 'addition' but not closed under 'subtraction'.

**Def<sup>n</sup>:** Let,  $\circ$  be a BC on a set  $A$ .  $\circ$  is said to be commutative if  $a \circ b = b \circ a \forall a, b \in A$ .

$\circ$  is said to be associative if  $a \circ (b \circ c) = (a \circ b) \circ c \forall a, b, c \in A$ .

Contd.

**Ex.6.** Addition on the set  $R$  is both commutative and associative but subtraction on set  $R$  is neither commutative nor associative.

**Ex.7.** Let,  $S$  be a non empty set &  $P(S)$  be the power set of  $S$ . Then  $\cup$  and  $\cap$  are BC on  $P(S)$ . Both are commutative and associative.

**Ex.8.** Let,  $M_2(R)$  be the set of all  $2 \times 2$  real matrices. Let  $\circ$  stand for multiplication of matrices.

Then

$\circ$  is associative?

$\circ$  is commutative?

Ans.  $\circ$  is associative but not commutative.

Contd.

## Groupoid

Let  $G$  be a non empty set on which a BC  $\circ$  is defined. Some algebraic structure is imposed on  $G$  by the composition  $\circ$  and  $(G, \circ)$  become a algebraic system. The algebraic system  $(G, \circ)$  is said to be a groupoid. The groupoid  $(G, \circ)$  is comprised of two entities, the set  $G$  & the composition  $\circ$  on  $G$ .

**Ex.1.**  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, -)$  are both groupoids. So same set make different groupoids.

**Ex2.**  $(\mathbb{Q}, +)$ ,  $(\mathbb{R}, +)$ ,  $(\mathbb{Q}, \cdot)$ ,  $(\mathbb{R}, \cdot)$  are groupoids.

**Def<sup>n</sup>:** A groupoid  $(G, \circ)$  is said to be a commutative groupoid if the BC  $\circ$  is commutative.

An element  $e$  in  $G$  is said to be an identity element in the groupoid  $(G, \circ)$  if  $a \circ e = e \circ a = a \ \forall \ a \text{ in } G$ .

Contd.

**Ex1.**  $(\mathbf{Z}, +)$  is a commutative groupoid but  $(\mathbf{Z}, -)$  is not a commutative groupoid.  $0$  is an identity element in  $(\mathbf{Z}, +)$ . There is no identity element in  $(\mathbf{Z}, -)$ .

**Def<sup>n</sup>:** An element  $e$  in  $G$  is said to be a right identity in the groupoid  $(G, o)$  if  $a o e = a \forall a$  in  $G$ .
