

## Contd.

**Ex1.** Let  $(S, o)$  be a semigroup with the identity element  $e$ . If for each  $a \in S$  there exists an element  $a'$  in  $S$  such that  $a o a' = e$ . Show that  $(S, o)$  is a group.

**Sol<sup>n</sup>:** It is given that  $e o a = a o e = a \forall a \in S$ .

By the cond<sup>n</sup> each element in  $S$  has a right inverse in  $S$ .

Let  $a''$  be a right inverse of  $a'$

i.e.  $a' o a'' = e$ .

$$\begin{aligned} \text{Now } a' o a &= (a' o a) o e = (a' o a) o (a' o a'') \\ &= a' o (a o a') o a'', \text{ since } o \text{ is associative} \\ &= (a' o e) o a'' = a' o a'' = e \end{aligned}$$

Thus  $a' o a = a o a' = e$  & this shows that  $a'$  is the inverse of  $a$ .

Thus each element in  $S$  has an inverse & hence  $(S, o)$  is a group.

## Contd.

**Ex2.** Let  $(S, o)$  be a semigroup with a right identity element  $e$ . If for every two distinct elements  $a, b \in S$  there exists a unique  $x$  in  $S$  such that  $a o x = b$ . Show that  $(S, o)$  is a group.

**Sol<sup>n</sup>:** By the cond<sup>n</sup>,  $a o e = a \forall a \in S$ .

Let,  $a \neq e$ . Then there exists a unique element  $a'$  in  $S$  such that  $a o a' = e$ . This shows that  $a$  has a right  $e$ -inverse.

By the cond<sup>n</sup>  $e o e = e$ . This shows that  $e$  has a right  $e$ -inverse.

Consequently, each element in  $S$  has a right  $e$ -inverse.

Thus  $(S, o)$  is a semigroup with a right identity element  $e$  and each element in  $S$  has a right  $e$ -inverse. Therefore  $(S, o)$  is a group.

Contd.

**Ex3.** Let  $(G, o)$  be a group &  $a \in G$ . Show that  $aG = G$  where  $aG = \{a o g : g \in G\}$

**Sol<sup>n</sup>:** Let,  $p \in aG$ . Then  $p = a o g$  for some  $g \in G$   
 $a o g \in G$  since  $a \in G$  &  $g \in G$ .

Therefore  $p \in G$ .

Thus  $p \in aG \Rightarrow p \in G$ . Therefore  $aG \subset G \rightarrow (i)$

Let,  $q \in G$ . There exists a unique element  $x$  in  $G$  such that  $a o x = q$ .

As  $q = a o x$  &  $x \in G$ ,  $q \in aG$

Thus  $q \in G \Rightarrow q \in aG$ .

Therefore  $G \subset aG \rightarrow (ii)$

From (i) & (ii)  $G = aG$ .

Contd.

## Subgroups

Let,  $(G,o)$  be a group &  $H$  be a non empty subset of  $G$ .  $H$  is said to be stable(closed) under  $o$  if  $a \in H, b \in H \Rightarrow aob \in H$ . If  $H$  is stable under  $o$  then the restriction of  $o$  to  $H \times H$  is a mapping from  $H \times H \rightarrow H$ . This restriction say  $*$  is a composition on  $H$  & is defined by  $a*b = aob \quad \forall \quad a, b \in H$ .  $*$  is called the induced composition on  $H$ .

**Def<sup>n</sup>:** Let  $(G,o)$  be a group &  $H$  be a non empty subset of  $G$ . If  $(H,o)$  is a group where  $o$  is the induced composition then  $(H,o)$  is said to be a subgroup of  $(G,o)$ .

**Ex1.** Let  $(G,o)$  be a group &  $e$  be the identity element.  $G$  being a subset of  $G$ ,  $(G,o)$  is a subgroup of  $(G,o)$ . This subgroup  $(G,o)$  is said to be the improper subgroup of  $(G,o)$ .

The singleton set  $\{e\}$  forms a group under the induced composition  $o$ . The subgroup  $(\{e\},o)$  is said to be the trivial subgroup of  $(G,o)$ .

## Contd.

The subgroup other than  $(G,o)$  and  $(\{e\},o)$  are said to be nontrivial proper subgroups of  $(G,o)$ .

Ex2.  $(Q,+)$  is a group.  $Z$  is a non empty subset of  $Q$  and  $(Z,+)$  is a group. Therefore  $(Z,+)$  is a subgroup of  $(Q,+)$ .

Ex3.  $(Q,+)$  is group.  $Q^*=Q-\{0\}$  is a subset of  $Q$  and  $(Q^*,.)$  is a group. But  $(Q^*,.)$  is not a subgroup of  $(Q,+)$ .

Contd.

**Theorem:** Let,  $(H,o)$  be a subgroup of  $(G,o)$ . Then

i) the identity element of  $(H,o)$  is the identity element of  $(G,o)$

ii) if  $a \in H$  then the inverse of  $a$  in  $(H,o)$  is same as the inverse of  $a$  in  $(G,o)$ .

**Proof:** i) Let,  $e_H$  be the identity element in  $(H,o)$  &  $e_G$  be the identity element in  $(G,o)$ .

Then  $e_H o h = h o e_H = h \forall h \text{ in } H$ .

Also  $e_G o h = h o e_G = h$ , considering  $h$  as an element of  $G$ .

It follows that  $h o e_H = h o e_G$  in  $G$ .

Therefore  $e_H = e_G$  by left cancellation law in  $(G,o)$ .

ii) Let,  $a'$  be the inverse of  $a$  in  $(H,o)$  &  $a^{-1}$  be the inverse of  $a$  in  $(G,o)$ .

Then  $a' o a = a o a' = e_H$ , since  $(H,o)$  is a group.

## Contd.

Also  $a^{-1} \circ a = a \circ a^{-1} = e_G$

It follows that  $a' \circ a = a^{-1} \circ a$  in  $(G, \circ)$  by (i)

Therefore  $a' = a^{-1}$ , by right cancellation law in  $(G, \circ)$ .

**Theorem:** Let,  $(G, \circ)$  be a group. A non-empty subset  $H$  of  $G$  form a subgroup of  $(G, \circ)$  iff

i)  $a \in H, b \in H \Rightarrow a \circ b \in H$ , and

ii)  $a \in H \Rightarrow a^{-1} \in H$

**Proof:** Let  $(H, \circ)$  be a subgroup of  $(G, \circ)$ .

Since  $(H, \circ)$  is a group, (i) and (ii) are satisfied.

Conversely, let  $H$  be a non-empty subset of  $G$  satisfying (i) and (ii).

Since (i) holds,  $H$  is closed under  $\circ$ .

Since  $H$  is a subset of  $G$  and  $\circ$  is associative on  $G$ ,  $\circ$  is then associative on  $H$ .

Since (ii) holds, the inverse of each element in  $H$  exists in  $H$ .

Contd.

Let  $a \in H$ . Then by (ii)  $a^{-1} \in H$ . And since  $a, a^{-1} \in H$ , (i) implies  $a \circ a^{-1} = e \in H$ .

Therefore  $(H, \circ)$  is a group and hence  $(H, \circ)$  is a subgroup of  $(G, \circ)$ .
